Sanjay Ghodawat International School, Maharashtra

The movie - The 4th revolution: Energy Autonomy was released in 2010 depicting the significance of energy transition, directed by Carl-A. Fechner. Around 2 billion population is unreachable to basic facilities like electricity, oil supply. The movie illustrates the myth created by the business class about the necessity of nuclear power. It revolves around a vision to create renewable energy 'for everybody' without emission.

Every year, corporates have to establish 20 new power plants, which traces the unstable weather conditions we are facing today. Every region of the world is blessed with at least one of the renewable resources gifted by nature like solar, wind, bio-sources, hydropower and so forth. In this movie, Elon Musk predicts his future invention of the electric car to serve nature with zero-emission transport – tesla.

The essence of the movie is to create a world where every person is accessible to the same kind of energy source, be it African villages or Los Angeles. It wants us to become aware of corporations who get privileges by distributing energies that are harmful to future generations. So, the question is, which energy source do you choose to use?
