

# SAVING GRACE

Deepika

*Earth Root Foundation, New Delhi*

The luxury of today might not be present in  
tomorrow,  
The beauty that captures us and the resources  
we enjoy,  
Might become a thing of past, a reminiscence,  
If we couldn't solve the problems we created as  
we climbed high;

Fossil fuels, coal and petroleum,  
Their depletion rate is scarier than  
Frankenstein,  
Green house effect and global warming,  
If not controlled, can send mother earth to early  
after life;

Green energy and other alternatives,  
Conserving, sustainable and judicious use,  
The efforts done at an individual level,  
Will be the butterfly effect, our saving grace.

## ENERGY CONSERVATION

- All filters in your house should be cleaned or replaced on a regular basis. Filters that are dirty cause your system to work harder and operate longer than it should.
- When cooking, use your microwave instead of your stove.
- To keep your refrigerator and freezer working effectively, defrost them before the ice builds up to 1/4-inch thick.
- Close the blinds, shades, and curtains on the sunny side of your home during the summer months to help keep your home cooler and lessen the work your air conditioner has to do.
