Polar Bear is a 2022 American <u>nature</u> documentary film about <u>polar bears</u> directed by <u>Alastair Fothergill</u> and Jeff Wilson. Narrated by <u>Catherine Keener</u>, it is the sixteenth nature documentary to be released under the <u>Disneynature</u> label. The film was released as a <u>Disney+</u> exclusive on <u>Earth Day</u> April 22, 2022.

PLOT

A mother polar bear and her cub swim across the waters that was once the ice of the Arctic Tundra, as the film tells us the story of how she and her family survived during her youth. She had loved playing with her twin brother as they were watched and protected by their mother, as she goes seal hunting and keeping a look out for male polar bears who threaten the cubs, they even came across a dead whale, and they, along with many other bears, feasted on it. Sadly one day, the polar bear's brother died, and it was only her and her mom left, she successfully hunted a baby walrus abandoned by a panicked mother. The bear's mother knew it's time to fend for herself again, and departs. The polar bear then spent years not seeing another ice bear, until she meets another male her age and they spend a day playing together, as he bids farewell, she realizes she was being tracked by a much bigger male. Thinking he was going to kill her, she stands her ground, but soon realizes she was being courted. As the big male and the female go their separate ways, the polar bear soon becomes a mother of one cub. In the present day, the mother and daughter spend their days surviving in the disappearing Arctic, the female knows her daughter will have what it takes to become a good ice bear, with a concerned guestion on what kind of world will she call home. The film ends with a message reading, "The Arctic could be icefree by the summer of 2040, the actions we take today can positively change the future of polar bears."
